McLaren Introduces Nu-Air™ Semi Pneumatic Tires for Skid Steers

After years of extensive research and development, McLaren Industries, a leading manufacturer of rubber and steel tracks, announced the newest addition to its product line – heavy-duty all-purpose tires for skid steers.

An expert design with cutting-edge, semi-pneumatic technology, McLaren Nu-Air tires are so advanced that they cannot be classified as pneumatic, foam-filled, or solid tires.

These tires are engineered to deliver the durability of solid tires with the soft, cushioned ride of pneumatic tires – all in one product.

Manufactured from heavy-duty rubber compounds, these tires are designed to withstand the harshest operating conditions and the most massive loads. These all-terrain tires provide maximum performance both on- and off-road, even in severe cutting conditions. The specially engineered tire structure prevents cuts and snags, ensuring that users will never lose valuable time and money due to tire punctures again. The deep lug tread pattern is designed to provide unrivaled traction, even in snow, sand, or deep mud.

Nu Air tires provide the strength and stability of a solid tire with the smooth, cushioned ride of a pneumatic tire, assuring unmatched comfort for the machine's operator and maximum performance and longevity from the machine itself. Tests have shown that Nu Air has three times the life expectancy of a pneumatic tire. These tires are built tough for unparalleled dependability and wear-resistance, resulting in a dramatic increase to the owner's bottom line.
